Phishing Awareness Training

Recognizing and Avoiding Social Engineering Attacks

Muhammad Arslan Nadeem
(Rhombix Technologies Intern)

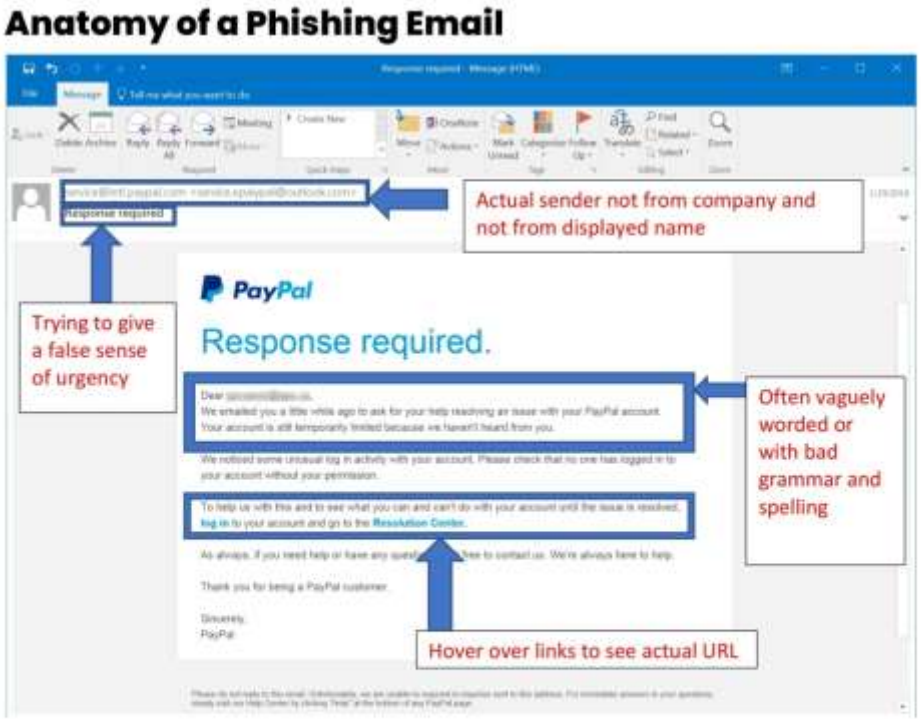

What is Phishing?

- A cyber attack where attackers impersonate trusted entities to steal credentials or install malware.
- Human error is the leading cause of data breaches.

The 5 Red Flags (Warning Signs)

- Urgency/Threats (e.g., "Account suspended in 24 hours").
- Unusual Sender Addresses (Lookalike domains).
- Suspicious Links (Hover to see the real URL).
- Unexpected Attachments (PDF.exe, ZIP files).
- Requests for Credentials (Banks/IT will never ask for passwords).

Real-World Example (The Fake Invoice)

Even if you think the email is legitimate, if it is not something you are expecting it is a good idea to contact the person you believe to be the sender "out-of-band," or by another method than clicking "reply" or any links in the email. For example, call a phone number you know belongs to the institution or person or go directly to their website by typing in the URL.

Prevention & Response

- Stop. Verify through a different channel.
- Report to IT.
- Enable Multi-Factor Authentication (MFA).
